1 Introduction

— CHANNEL STRIP (TBD) —

1.1 Functionality

This plug-in is designed to work with DAWs which support VST3. The intent is to work as a channel strip which provides a complete basic effect chain for all incoming signals - working much like a physical mixer.

1.2 Background

This channel strip plug-in began as a university project at Karlstad University the summer of 2025, developed in its entirety by embedded software developer August Jansson.
